Applicant(s)

PERROT ET AL.

Examiner

SABA TSEGAYE

Art Unit

2467

Period for Reply -- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 26 August 2009.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1 and 3-16 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1 and 3-16 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
- Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
- Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☐ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☐ Information Disclosure Statement(s) (PTO/SB/22)
- Paper No(s)/Mail Date _____

- 4) ☐ Interview Summary (PTO-413)
- Paper No(s)/Mail Date _____
- 5) ☐ Notice of Informal Patent Application
- 6) ☐ Other: _____

DETAILED ACTION

Response to Amendment

1. This Office Action is in response to the amendment filed 08/26/09. Claims 1 and 3-16 are pending. Currently no claims are in condition for allowance.

Claim Rejections - 35 USC § 103

2. Claims 1 and 3-16 are rejected under 35 U.S.C. 103(a) as being unpatentable over Bender et al. (WO 00/18066) in view of Joy et al. (US 2005/0157732 A1) and The Admitted Prior Art ("APA") as disclosed in applicant's specification Fig. 1, page 1 line 12-22.

Regarding claims 1 and 15, Bender discloses a method for connecting a device (40) not having wireless communication capability to a wireless network; characterized, at the level of a bridge device (42) comprising means for interfacing with the wireless network (56) comprising and access point (58, 60) (see fig. 4), by the steps of:

detecting a connection between the device and the bridge device (page 8, lines 1-25);
determining an address (*when power initially applied to the terminal equipment unit 40 and the wireless modem 42, each of them has a **unique hardware address**...message (that specifies the terminal equipment units permanent hardware address) is broadcasted to the network remote server 60*) for the device and for the bridge device (page 9, lines 28-31; page 11, lines 3-5; page 10, lines 19-23);

separately registering to the access point, with the respective addresses, the device and itself as wireless devices on the wireless network (page 9, lines 7-12; page 10, lines 19-23; page 11, lines 3-7), so that said wireless device connected to said wireless network appear as wireless

stations to the access point (the transceiver 46 typically comprises a wireless link communication module to perform the radio link protocol and physical layer functions).

Bender discloses, as pointed out above, when a terminal equipment unit is first powered on, it broadcasts a message intended for the network remote server 60. The broadcast message specifies the terminal equipment unit's permanent **hardware address** to request and IP address. Furthermore, it is well known that a MAC address is a hardware address that uniquely identifies each node of a network. Bender does not expressly disclose that the hardware address is a MAC address.

Joy teaches that MAC address (Ethernet address) is unique address used on a network in order to ensure that a given packet will arrive at the correct destination (0005).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to substitute a MAC address, such as that suggested by Joy, to the hardware address of Bender in order to ensure that a given packet will arrive at the correct destination, thereby provides a secure system.

Further, Bender does not expressly disclose wherein the registration is performed through an authentication and an association process of the type as defined by the IEEE 802.11 standard.

However, Bender discloses, on page 13, lines 19-20, that the wireless link connection may operate under one of a plurality of well known or later developed operating protocols. Further, Bender discloses that a standard IP suit system connecting the wireless modem 42 and a network unit 58 over a wireless link 56. The IP suit may be used to inter-network a diverse range of LANs and WANs (page 6, line 27-page 7 line 5).

APA teaches that it is well known for wireless network to use the IEEE 802.11 specification to allow stations on the wireless network to exchange data (page 1).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to use IEEE 802.11 standard in the system of Bender in order to use a set of standard for wireless LAN to exchange data.

Regarding claim 3, Bender discloses the method further comprising the step of having the bridge device monitor traffic on the wireless network for the device (see fig. 4)

Regarding claim 4, Bender discloses the method further comprising the step of programming packet filters for packets having as destination address the address of the device, and upon detection of such a packet, acknowledging receipt of the packet in place of the device (page 12, lines 3-14).

Regarding claims 5 and 6, Bender discloses the method further comprising at least one of the following steps: forwarding all multicast packet on the wireless network from the bridge device to the connected device; forwarding all broadcast packets detected on the wireless network from the bridge device to the connected device; forwarding unicast packets on the wireless network having as destination the address of the connected device to that device (page 5, lines 6-20).

Regarding claims 7-9, Bender discloses the method where the connection between the device and the bridge device is an Ethernet connection, and wherein the step of detecting the

connection comprises monitoring packets on the Ethernet connection for detecting a previously unknown source address of and Ethernet device (page 6, lines 8-14).

Regarding claims 10-13, Bender discloses the step of maintaining a single management information base for both the bridge device and the connected device (see Fig. 3a; the transceiver 44 comprises a standard Ethernet communication card; the transceiver 46 typically comprises a wireless link communication module; **the processor 48 interfaces with transceivers 44 and 46 as well as a memory unit 50**).

Regarding claims 14 and 16, Bender discloses bridge device (42) comprising means for communication on a wireless network (56) and for connection of a first device (40) not having wireless communication capability (Ethernet connection) to a wireless network comprising an access point (58, 60), the bridge device comprising:

means for determining an address (*when power initially applied to the terminal equipment unit 40 and the wireless modem 42, each of them has a **unique hardware address**...message (that specifies the terminal equipment units permanent hardware address) is broadcasted to the network remote server 60*) of the first device and of the bridge device (page 9, lines 28-31; page 11, lines 3-5; page 10, lines 19-23);

means for carrying out two separate device registrations on the wireless network, one for the bridge device, and one for the first device, using respective addresses (page 9, lines 7-12; page 10, lines 19-23; page 11, lines 3-7), so that said wireless device connected to said wireless network appear as wireless stations to the access point (the transceiver 46 typically comprises a

wireless link communication module to perform the radio link protocol and physical layer functions).

Bender discloses, as pointed out above, when a terminal equipment unit is first powered on, it broadcasts a message intended for the network remote server 60. The broadcast message specifies the terminal equipment unit's permanent hardware address to request and IP address. Furthermore, it is well known that a MAC address is a hardware address that uniquely identifies each node of a network. Bender does not expressly disclose that the hardware address is a MAC address.

Joy teaches that MAC address (Ethernet address) is unique address used on a network in order to ensure that a given packet will arrive at the correct destination (0005).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to substitute a MAC address, such as that suggested by Joy, to the hardware address of Bender in order to ensure that a given packet will arrive at the correct destination, thereby provides a secure system.

Further, Bender does not expressly disclose wherein the registration is performed through an authentication and an association process of the type as defined by the IEEE 802.11 standard.

However, Bender discloses, on page 13, lines 19-20, that the wireless link connection may operate under one of a plurality of well known or later developed operating protocols. Further, Bender discloses that a standard IP suit system connecting the wireless modem 42 and a network unit 58 over a wireless link 56. The IP suit may be used to internetwork a diverse range of LANs and WANs (page 6, line 27-page 7 line 5).

APA discloses that it is well known for wireless network to use the IEEE 802.11 specification to allow stations on the wireless network to exchange data.

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to use IEEE 802.11 standard in the system of Bender in order to use a set of standard for wireless LAN to exchange data.

Response to Arguments

3. Applicant's arguments filed 08/26/09 have been fully considered but they are not persuasive. Applicant argues (Remarks, page 8) *that "the access point" unit 58 cited in Bender does not disclose or suggest, and it not equivalent to the wireless access point, as presently claimed in claims 1, 14, 15 and 16. Significantly, not that the "access point" of Bender is a combination of a network unit 58 and a network remote server 60. The network unit 58 is wirelessly connected to the wireless modem 42, however, the network unit 58 and network remote server 60 do not constitute a wireless network. Accordingly, the access point of Bender is not an access point of a wireless network, and Bender fails to disclose or suggest at least a wireless network comprising a wireless access point.* Examiner respectfully disagrees. The access point cited in Bender is equivalent to the wireless access point as presently claimed 1, 14, 15 and 16 and the access point 26, in the present application (as shown in fig. 2), which is connected to a wired sub-network 22. Furthermore, Bender clearly shows that the communication between the wireless modem 42 and network unit 58 is wireless. Also, Bender discloses that the wireless modem 42 is defined as a gateway between the Ethernet subnet and the external network (page 10 lines 22-23).

Applicant argues (page 8) that *neither, Bender, the APA or Jo disclose or suggest that the device and the bridge device are separately registered to the wireless access point with their respective MAC address as wireless devices on the wireless network, as essentially recited in claims 1, 14, 15 and 16. In Bender, only the wireless modem 42 is registered as a wireless device to the network unit 58, the wireless link of Bender is a point to point wireless link. The device 40 is recorded to the access point with an IP address and hardware address. Bender's device 40 is not registered and a wireless device to and access point, much less a wireless access point.*

Examiner respectfully disagrees with Applicant contention. Bender clearly discloses wireless modem 42 and terminal 40 are registered to access point 58 with their IP and hardware address. Further, Bender discloses that "... the terminal unit 40, as well as the wireless modem 42, **must be assigned an IP address so that each may be addressed individually within the system...** in addition, the use of independent IP addresses allows the terminal equipment unit 40 and the wireless modem 42 to exchange IP messages intended for one another." See page 9, lines 8-12.

Applicant argues (page 9) that *"the present specification indicates that some adaptation is necessary in a bridge device to support the registration method of the claimed embodiment..."* While this may be true, the claim language is much broader and does not require these limitations. It is the claims that define the claimed invention, and it is claims, not specifications that are anticipated or unpatentable. *Constant v. Advanced micro-Devices* states, *"A general allegation that the claims define a patentable invention without specifically pointing out how the language of the claims patentably distinguishes them from the references does not comply with the requirements of this section."* Applicant has failed to specifically point out how the language of the claims patentably distinguishes them from the references.

On page 10, Applicant argues that “...*the registration is not performed through an authentication and association process of the type as defined by the IEE. 802.11 standard...*”

Examiner respectfully disagrees. Bender discloses that wireless modem routes packets over wireless link using a conventional wireless protocol. The wireless link connection may operate under one of a plurality of well known or later developed operating protocols (abstract; page 13, lines 19-22). Further, Bender suggests that the wireless modem may be installed within a lap top computer. APA asserts that it is well known for wireless network to use the IEEE 802.11 specification to allow stations on the wireless network to exchange data. Examiner believes that the claims, given their broad reasonable interpretation, read on the reference applied.

Conclusion

4. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to SABA TSEGAYE whose telephone number is (571)272-3091. The examiner can normally be reached on Monday-Friday (7:30-5:00), First Friday off.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Pankaj Kumar can be reached on (571) 272-3011. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only.
